

MELTING POINT OF WAX (11)

Aim

To determine the melting point of wax.

Materials and Apparatus

Tripod with mesh, water beaker, stirrer, stands, boiling tube, wax, thermometer, Bunsen burner, stop watch.

Theory

Melting of a substance involved a latent heat. Latent heat is the heat taken in or given out when a substance is changing state.

During phase change, the temperature remains unchanged. This is because the energy produced during the formation of bonds is equal to the heat energy released to the surroundings during cooling.

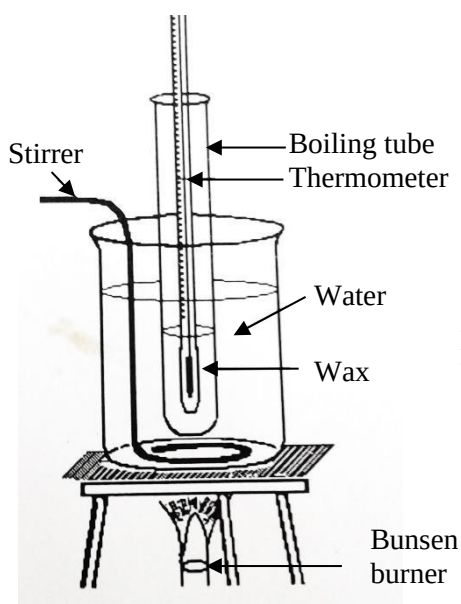

Fig. 1: Experimental Setup

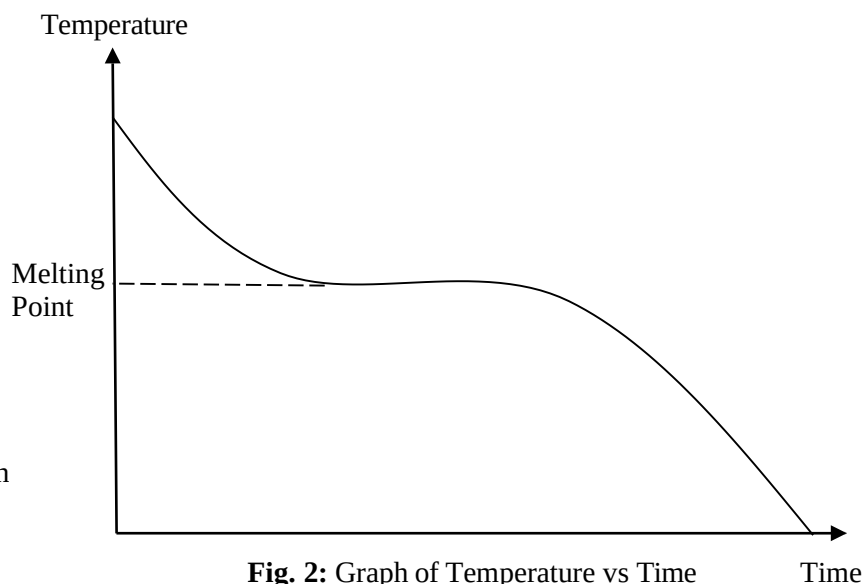

Fig. 2: Graph of Temperature vs Time

Procedure

- Immerse the boiling tube in a water beaker as shown in the **Fig. 1**.

Q1: How much water should be added to the beaker?

- Heat the water beaker until the wax melts.
- Insert the thermometer into wax and measure the temperature at 15 seconds intervals while cooling.
